Revenue % change by cities

- Over a glance we can notice that there is no huge gap between lowest and highest revenue % change.
- We can notice that good performing cities are mostly at the lower end of earning revenue and having an user base which means that there is high potential in tier 2/3 cities.

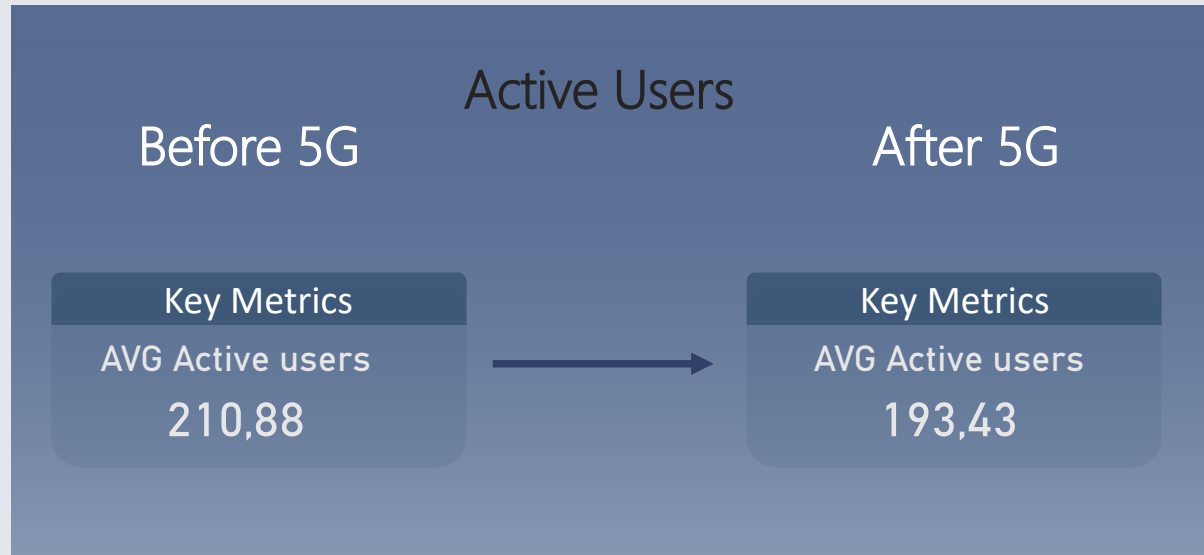

ARPU % change by cities

- Pune and Chennai have been the outliers amongst the cities in getting negative ARPU.
- The common ground between them is that both have gained active users.
- This indicates a possible negative correlation between active users and ARPU.

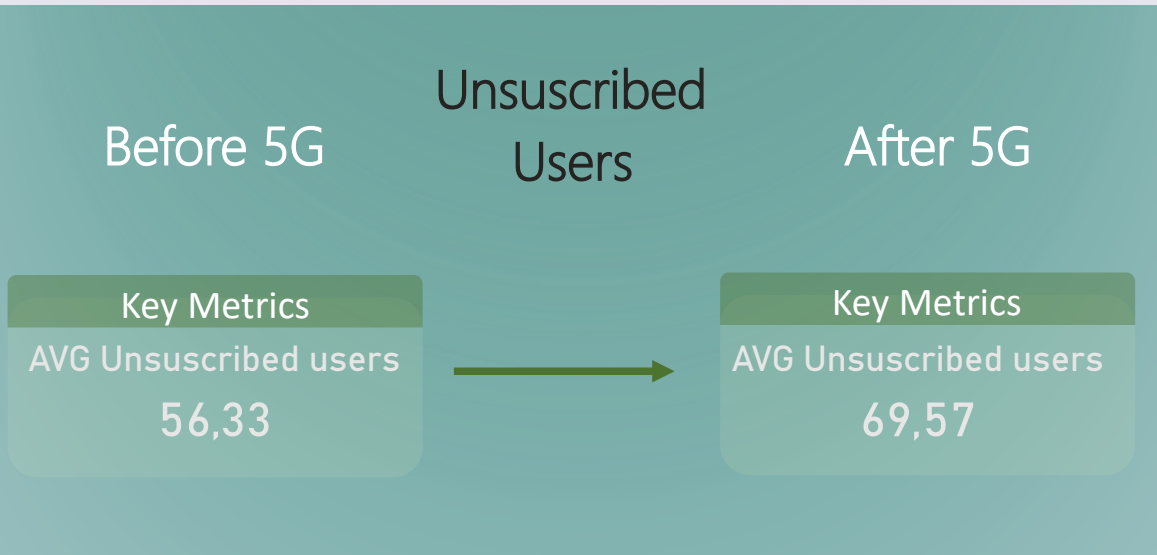

Users Analysis

- 13 out of 15 cities have experienced a decrease on active users, and since the market share has not changed, this could be explain through external factors.

Reason

The reason behind the increase of active users in these cities, could be the increase offers of low cost plans in huge cities.

- All cities expect Mumbai have experienced an increase in unsubscribed users, with Lucknow at the top at 79%, this could be due to an increase of 5G price plans so not too many people could afford it.

Reason

Mumbai is the only city with a decrease, this could be because is the capital and the need for fast internet is increasing.

Plan Revenue Analysis

Revenue % generated after 5G

plans	January	February	March	April	June	July	August	September

- Plan 1 has always been the strongest plan of the company, and grew even stronger after the introduction of 5G.

- Introducing new products (plan 11 and 12) have performed comparatively really well than most of existing products.

- Plans 2 and 3 have shown little impact from the introduction of 5G, which says that these plans could be a reliable source of income despite future changes.

- After the introduction of 5G, plans 4, 5 and 6 are performing really low, so the replace of these plans could be a possibility in the future.

City based Analysis

Around 60% of all the revenue and active users are concentrated into the 5 main cities (Mumbai, Kolkata, Delhi, Bangalore and Chennai).
